
b random-split controls on the same compounds

- **T** the 2010 time split
- **R1** random, same held-out size
- **R2** + held-out positive rate as in T
- **R3** + training positive rate as in T

constraints added

c measured on the held-out set

- **discrimination** — AUROC against random partitions
- **calibration** — ECE and the Murphy decomposition
- **coverage** — split conformal prediction
- **remedies** — recalibration, periodic retraining

matching the rates costs held-out size: 156 and 267 drop to 92 and 189
